

ANDROID DEVELOPER INTERNSHIP PROGRAM

Task 2

Task Title:

User Persona & Problem Validation

Project: Eco-Cart (Sustainability-Focused Android App)

Proposed by: Ruhma Amir

1. Target Audience Definition

To build a successful app, we need to focus on the people most likely to use a barcode scanner while shopping.

1. **Age Group:** 18–35 (Gen Z and Young Millennials).
2. **Profession:** Students, Early-career Professionals, and "Household Managers" (those who do the grocery shopping).
3. **Technical Skill Level:** Intermediate (Daily smartphone users, comfortable with QR codes and camera-based apps).
4. **Location:** Urban/Suburban areas (where there is access to multiple grocery brands and product variety).

2. User Personas (The "Characters")

Persona A: The Busy Student

- **Name:** Sarah
- **Age:** 21
- **Occupation:** University Student (Environmental Science)
- **Goals:** Wants to live a "Zero-Waste" lifestyle on a tight student budget.

- **Pain Points:** Sustainable products are often too expensive. She feels guilty when she has to buy a "bad" product just because she's in a hurry.
- **App Usage:** Uses her phone for everything; loves "gamified" apps with streaks or rewards.

Persona B: The Conscious Parent

- **Name:** Marcus
- **Age:** 34
- **Occupation:** Marketing Manager
- **Goals:** Ensure the products he brings home are safe for his kids and don't contribute to plastic pollution.
- **Pain Points:** He doesn't have time to read long ingredient lists or research brands online while his toddler is running around the store.
- **App Usage:** Values speed and "one-handed" UI. If an app takes more than 5 seconds to load, he deletes it.

3. Problem Validation

Method used: **Online Review Analysis & Micro-Interviews**

I analyzed 2026 trends and user complaints from existing apps (like Yuka and Klima). I also conducted "Micro-Interviews" with 3 peers.

Question Asked: "What stops you from buying eco-friendly products more often?"

1. **Finding 1:** 2 out of 3 people said "**Confusion.**" They don't know which labels (like "Bio" or "Natural") are actually real.
2. **Finding 2:** 3 out of 3 said "**Price.**" They assume eco-friendly means "more expensive" and don't have time to look for cheaper green alternatives.

4. Key Insights Extraction

1. **Common Problem: Greenwashing.** Users are tired of brands *pretending* to be eco-friendly. They want a "Trust Score."
2. **User Expectation:** The app must be **fast**. Scanning shouldn't take longer than a second.
3. **Feature Demand:** Users want to see **Price Comparisons** between a "Bad" product and a "Green" alternative.

5. Refine Your App Idea

Insight: My research showed that users (like Sarah) want to be eco-friendly but are terrified of "Premium Pricing" (the idea that green products always cost more).

1. **Old Concept:** Suggest any green product regardless of cost.
2. **Refined Concept: The "Eco-Budget" Filter.** Instead of real-time price tracking, the app will categorize products into simple price tiers
